We claim

- A solid or semisolid, at least two-phase active ingredient-containing formulation in which there is multiparticulate incorporation of/one of the two phases into a matrix of the other phase, and/at least one of the phases contains at least one active ingredient, obtainable by introducing particles of one phase into the other phase in a 10 plastic state, and shaping the material while still plastic.
- A formulation as claimed /in/claim 1, in which at least one active ingredient is present in the phase in multiparticlate dispersion. 15
 - A formulation as claim# $\frac{d}{dt}$ in/claim 1 or 2, in which one phase is introduced in the form of crystals, pellets, microtablets or granules into the melt of the other phase.
 - A formulation as claimed in claims 1 to 3, comprising a flavoring in the/carrier matrix.
 - A process for producing a formulation as claimed in claim 1 or 2, which comprises plasticizing a mixture of the components of the matrix phase by energy input, incorporating at least one other active ingredient-containing phase in the form of particles homogeneously into the matrix phase during or after the plasticization, and subsequently shaping the material while still plastic.
- A process as claimed in claim 5, wherein the mixture of the matrix phase is plasticized (until) the specific viscosity is from 0.007 to 10,000 Pa.s (at 160°C). 35
